Introduction

Planning on creating a Recipe Recommender based on food ingredients. It will recommend recipes from the database catering to exactly the ingredients a person has, or near to what he/she has.

This app will also allow a person to make profiles, favourite/delete dishes/recipes from their profiles. Users will also be able to add their own recipes.

I will add more features moving forward.

Technologies to be used

I have been thinking of using the MERN(MongoDB, Express.js, ReactJS, Node.js) stack.

ReactJS will be used for front-end. Node.js, Express.js will be used for back-end.
